3 **'Impact', research and slaying Zombies: The pressures and possibilities of the REF**
4

5 **Abstract**
6

- 7
8
9 • **Purpose:** The paper reflects critically upon current debates and tensions in the
10 governance of research in the UK and more widely, particularly the imperative that
11 social science research should demonstrate impact beyond the academy.
12
13 • **Design/methodology/approach:** Drawing implicitly upon Bevir's theory of
14 governance, the paper positions discourses about 'research excellence and research
15 impact' as elite narratives that are rooted genealogically in forms of managerial audit
16 culture which seek to govern the practices of social science academics. The article
17 reviews relevant literature, draws upon key contributions that have shaped debate
18 and refers to the author's own research and experiences of 'research impact'.
19
20 • **Findings:** Initiatives such as the UK's 'Research Excellence Framework' (REF) can be
21 understood as a form of governance that further enables already present neo-
22 liberalising tendencies in the academy. The 'impact agenda' has both negative (e.g. it
23 can distort research priorities and can lead to overstatement of 'real world' effects)
24 and positive potential (e.g. to provide institutional space for work towards social
25 justice, in line with long-standing traditions of critical social science and 'public
26 sociology').
27
28 • **Research limitations/implications:** There is a need for more critical research and
29 theoretical reflection on the value, threats, limitations and potential of current forms
30 of research governance and 'impact'.
31
32 • **Originality/value:** To date, there are very few article-length, critical discussions of
33 these developments and issues in research governance, even fewer that connect
34 these debates to longer-standing radical imperatives in social science.

Key words: research excellence/ research impact/ governance/ REF/

Classification: Conceptual paper

Introduction

Such is the strength of hostility in respect of new forms of research governance in the UK that critics picture universities as being in the grip of 'a monster, a Minotaur that must be appeased by bloody sacrifices', first among these being academic principle and freedom (Scott, 2013). Although the focus of the discussion in this paper is the UK its relevance is not restricted to it; several other countries (e.g. Australia, Hong Kong, New Zealand) have developed similar systems for research governance and assessment (see Stahl, 2015). Drawing upon Bevir's (2013) ideas about decentered forms of governance, this article interprets such developments in UK research governance – specifically the increasing imperative, enshrined in the Higher Education Funding Council for England's (HEFCE) *Research Excellence Framework* (REF) and the conditions applied by UK Research Councils, to demonstrate 'real world' impact beyond the academy – as a form of *elite narrative* that seeks to govern the day to day practices of social scientists. REF requires researchers to explain and demonstrate the impact their studies have had in 'the real world', with multi-millions of pounds of funding resting on assessments of this. Because of its obvious connections with social improvement and reform through policy action, social policy is regarded as one disciplinary area that is well-placed to meet and benefit from this 'impact agenda'. Nevertheless, objections to REF, including to the impact agenda, have not subsided. Although some critical researchers welcome the opportunities provide by REF to engage in progressive, research informed practice, others see in it the grubby hands of neo-liberal governance further eroding academic freedom.

That said, there has been relatively little extended critique and discussion in social policy-oriented journals about the promises and possibilities posed by the REF and its specific demand for impact. The author's survey of the 39 issues of *International Journal of Sociology and Social Policy* published from 2010 until the time of writing (July 2016) uncovered no articles related to this topic. Similarly, the literature searches by Smith and Stewart (2015, 2016) found no articles at all about impact in social policy journals (with numbers in single figures for other social science disciplines), with the authors noting the 'remarkably muted' response from social policy academics to the REF impact agenda (2016). Commentators in sister disciplines have, however, argued on the one hand that the REF is a prime example of a further twist in the neo-liberal managerialism and audit culture of the

1
2
3 contemporary university and, as such, should be resisted. On the other, 'impact' is said to
4 allow spaces for progressive work towards social justice and thus warrants a cautious
5 welcome. This latter position suggests the opportunity for social science academics to
6 develop *local practices* to resist the elite narrative (Bevir, 2013).
7
8
9

10
11 These dilemmas are ones that are important and timely for those social scientists who,
12 through their research, seek to make the world better. In this vein, the author has
13 conducted research, with colleagues, that seeks to critique and debunk other powerful, elite
14 narratives; ones about the causes and nature of worklessness and poverty in the UK. The
15 researchers experimented with different ways to generate 'research impact' and were
16 deemed to have been very successful in that respect by the 2014 REF exercise. The article
17 draws on this research and these experiences as a case study in the possibilities and failures
18 of 'impact'.
19
20
21
22
23
24

25
26 The article is organised into four parts, following this introduction. *First*, a brief description is
27 given of these research projects, their findings and the attempts made towards impact.
28 *Second*, the UK system for research funding and specifically the recent advent of 'the impact
29 agenda' (under REF) is sketched out. Here we see how these systems for research
30 governance *might* encourage and reward exactly the sort of critical, influential social science
31 that many, including the author, have sought to produce. *Third*, ideas that are more critical
32 of this REF impact agenda are presented, including doubts about the real extent of research
33 impact (the case study examples included). *Fourth*, a 'synthetic' and pragmatic conclusion is
34 suggested: one that acknowledges that principled efforts at research impact can be limited
35 in their effect and be subsumed and commodified as just another aspect of the neo-liberal
36 governance and marketisation of HE, at the same time as underscoring the continuing value,
37 and necessity, of the attempts of a critical social science to confront dominant ideologies
38 and to attack social injustice.

49 **'Shirkers', 'Strivers' and 'Slaying Zombies': researching work, worklessness and welfare**

50

51
52 In 2012, the author, together with colleagues at Teesside University, published two related
53 and what proved to be two quite well-known studies about work, worklessness and welfare
54 in the UK: *Poverty and Insecurity: Life in Low-pay, No-pay Britain* (Shildrick et al, 2012a) and
55 *Are cultures of worklessness passed down the generations?* (Shildrick et al, 2012b). Each
56
57
58
59
60

1
2
3 study also spun off a series of papers in academic journals (e.g. MacDonald et al, 2013;
4 MacDonald et al, 2014).
5
6
7

8 The studies used qualitative methods to research the realities of working life and
9 unemployment for individuals and families living in deindustrialised localities. They showed
10 how economic marginality rather than complete economic exclusion was a predominant
11 experience. The 'low-pay, no-pay cycle' of churning between low paid, low skilled and
12 insecure jobs and periods of unemployment had become the norm. This precarity was
13 driven by the increased insecurity of jobs that failed to provide permanent employment and
14 to lift people away from poverty. The research also investigated a favoured trope of recent
15 UK governments (shared across the two main political parties) which presents unemployed
16 people as possessing 'a culture of welfare dependency' (HM Government, 2010) that is
17 passed down in 'households where three generations have never had a job' (Tony Blair,
18 1997) and were the 'life-style choice' of unemployment prevails (Osborne, 2010).
19
20
21
22
23
24
25
26
27

28 Unemployed lazy 'shirkers' are counter-posed in a moral binary with the 'strivers' and 'hard-
29 working families' beloved of politicians (Jowit, 2013).
30
31

32 Sociological research is not renowned for coming to unequivocal conclusions. These two
33 studies did. Powerful government and media-fomented narratives of an intergenerational
34 workshy underclass were, simply, without empirical foundation – at least in their ability to
35 explain anything other than the most extreme, atypical cases. Rather, conventional
36 attitudes to and ethics in respect of employment and welfare prevailed. Both studies have
37 been widely cited and the first went on to win the 2013 *British Academy Policy Press Peter*
38 *Townsend Prize* (this is noted not to brag but in advance of the later discussion about the
39 limits to the effects of this research).
40
41

44
45
46

47 Paul Spicker (2007: 102) describes how the long list of theories, stretching back over
48 decades (see Welshman, 2013), that blame the poor for their poverty and the unemployed
49 for their unemployment can be regarded as 'zombie arguments': 'no matter how many
50 times they are shot down in flames or have a stake driven through their heart ... [they] seem
51 to get up again afterwards'. When politicians and others assert *ad nauseam* that there are
52 'three (or four) generations of families where no-one has ever worked' it certainly feels like
53 we are dealing with a zombie argument. Spicker (2007: 102) goes on to say that, just
54
55
56
57
58
59
60

1
2
3 because these arguments 'keep coming back' does not mean 'we should lie down and let
4 the zombies win' (see MacDonald et al, 2013).
5
6

7 The team of researchers followed various strategies to try to 'kill zombies' and to make this
8 research influential outside of academia. As well as TV and radio news coverage, since 2012,
9 somewhere in the region of fifty news stories, comment pieces and features about the
10 research have appeared in regional and local newspapers, national 'quality' broadsheets
11 (e.g. *The Guardian*, *The Independent*, *The Independent on Sunday*, *The Observer*, *The*
12 *Financial Times*, *The Herald*), national tabloids (*The Daily Star*) and in foreign news media
13 (Germany, Norway, Singapore). At times this has evoked strong public interest. For example,
14 in 24 hours there were 500 comments posted in *The Guardian* in response to one feature
15 (13th December 2012). Social media was used as well. The Joseph Rowntree Foundation
16 (JRF) estimates that one tweet about the research had, within a month, over one million
17 'impressions' on Twitter. One blog post for JRF was the most successful (in terms of 'hits')
18 that they had ever hosted, at that point and another for the US site *Working Class*
19 *Perspectives* had twenty thousand hits in the first week (again, the highest recorded at that
20 point). Between them the researchers have spoken about these research projects at over
21 100 events, many by invitation and many have been to non-academic audiences (e.g. to
22 members of the public, welfare practitioners, policy makers, politicians, Trade Unionists,
23 school pupils).

29
30
31
32
33
34
35
36
37

38 Another strategy for disseminating the research findings and engaging with people who
39 might be able to use it was via a Knowledge Exchange Project (KEP) (MacDonald et al, 2012),
40 run in conjunction with a local authority and a network of voluntary sector agencies in
41 Teesside. Part of the motivation was to ensure that the research was known to *local* policy
42 makers, practitioners and politicians; the significance of this will become clearer later in the
43 discussion. Over eighteen months the KEP showcased particular aspects of the research at
44 seven events geared towards different audiences (e.g. the final event about policy
45 conclusions was mainly for employers and local authority representatives). In total around
46 four hundred people and over one hundred different organisations from Teesside and the
47 wider North East of England participated in the KEP.

2
3 A fuller account of these attempts to make the research influential is contained within the
4 'impact case study' that was submitted to the REF 2014 exercise¹ (which is explained
5 below). Given the coming discussion about the limits of research impact, it should be noted
6 that the researchers also sought to influence national government, via evidence to select
7 committees and meetings with Chairs of All Party Working Groups. The research has been
8 cited in debates in both Houses of Parliament.
9

14 **Research governance in the UK – and the advent of the 'impact agenda'**

16
17 Here we turn to a discussion of the way that UK university research is governed, assessed
18 and funded, paying particular attention to the valorisation of research that has impact
19 outside of academia. At least on the face of it, it would seem that there is a happy
20 congruence between emergent elite narratives and the practices of social science
21 researchers who strive for social change (as was the case with the Teesside studies).
22
23

24
25 The UK government funds research through two main methods (the so-called 'dual system'),
26 each of which is heavily skewed toward the concentration of resources in already successful,
27 'elite' universities. The 'Matthew Principle' is alive and well here; 'to he who has, shall be
28 given'. Firstly, academics can bid directly to a research council (such as the Economic and
29 Social Research Council, or ESRC) for funding. In 2012–13, universities (already) in the upper
30 20 per cent quintile for funding cumulatively secured 91.9 per cent of the total funding
31 awarded to universities from research councils (Universities UK, 2014). Secondly, so-called
32 QR funding is allocated to universities on the basis of the quality of their subject-specific
33 submissions to an (approximately) six-yearly, national research assessment exercise
34 (currently entitled the Research Excellence Framework or REF). In 2013-14 those universities
35 in the top 20 per cent of the funding distribution received 75 per cent of all QR funding
36 (ibid.). It is this second approach to research governance that is the main topic of this article.
37
38

39
40 Sayers (2015) helps us trace the genealogy of these assessment systems. With the rise of
41 the 'New Public Management' from the mid-1980s and the drive to improve public services
42 under 'best value regimes' (and pushed along by the more general neo-liberal thinking of
43 the Conservative and, later, New Labour governments), came an emphasis on
44 accountability, measurable outcomes and the quantification of performance (and the de-
45 emphasising of activities that could not be easily measured) (McLaughlin et al, 2002).

56
57
58
59
60

1
2
3 Universities were not immune from these processes: 'questions were being voiced by
4 Ministers over whether much of the HE output was economically valueless...and should be
5 reduced in scale and somehow dramatically reformed' (Kogan and Hanney 2000: 89, cited in
6 Sayers, 2015). From 1981, university funding allocations began to reflect quality judgements
7 and thus began the explicit stratification of universities. Kogan and Hanney (2000: 97-98,
8 cited in Sayers 2015) repeat an anecdote from Christopher Ball (then Warden of Keble
9 College Oxford) about a dinner he attended with Peter Swinnerton-Dyer (chairman of the
10 University Grants Committee) and David Phillips (Chairman of the Advisory Board for the
11 Research Councils):

12
13
14
15
16
17
18
19
20 we used to have dinner together and plan our strategy. One evening Peter said: 'I
21 can no longer defend the funding of universities...without real accountability to
22 government'... so we discussed it and I suppose at that dinner we invented the
23 research selectivity exercise.
24
25
26

27
28 Here we see the origin of a system of research governance that kicked off five rounds of the
29 Research Assessment Exercise (RAE), from 1986 onwards, and then the REF (which has had
30 one exercise so far, in 2014), a system that Stahl interprets as a major element within 'the
31 always expanding regimes of accountability and managerialism that are colonising all
32 aspects of university life' (2015: 623). At the time of writing, a government review about the
33 possibility and dimensions of a future REF (in 2020/2021) is underway. Around £1.6 billion
34 of so-called 'QR' funding is distributed annually in this way. These have become enormously
35 important in UK academia not only because of the funding that follows a successful
36 submission but because of the status that comes from appearing high in the league tables
37 for the quality of research that are subsequently published. Because of this, substantial
38 amounts of time, effort and money are spent in planning for REF and in preparing and
39 presenting submissions that are perceived to have the highest chance of being well judged
40 by the peer review panels that make the quality judgements (i.e. 4* 'world-leading, 3*
41 'internationally excellent', 2* 'internationally recognised', 1* 'nationally recognised' and
42 'unclassified').
43
44
45
46
47
48
49
50
51
52
53
54

55
56 The REF has come in for enormous criticism (see Wilsdon, 2015; and Sayer, 2014, for a
57 particularly damning account) because, for example: of the intrusive bureaucracy that it has
58
59
60

1
2
3 generated (diverting staff away from actually *doing* research or teaching); of its costs
4 (estimated to be around £250 million for REF2014); it is seen as divisive (some universities
5 exclude staff who are deemed not to score highly in these terms, with potentially negative
6 consequences for their careers); it may have narrowed academic priorities (encouraging
7 quicker, less risky research); quality judgements are necessarily subjective and contestable;
8 and because it is a 'game' that can be 'played'² (Gill, 2014; Scott, 2013). Phelan (2016)
9 equates these sort of 'bureaucratically elaborate audit regimes which purport to measure
10 the quality of academic research' as prime examples of the new 'surveillance mechanisms'
11 of the neo-liberal, 'corporate university'. Thus, REF has been accused of adding to an
12 'excessively managerial' approach that determines questions about 'hiring, firing and
13 promotion', that inhibits academic freedom, promotes a deadening 'audit culture' and,
14 essentially, adds to the armoury of management control (Gill, 2014).
15
16
17
18
19
20
21
22
23

24
25 A new element to the REF 2014 was that the impact of research outside of academic life
26 became an element in quality judgements. Similarly, UK research councils give great
27 emphasis to 'pathways to impact' in their funding decisions. For REF 2014, impact was
28 defined as 'an effect on, change or benefit to the economy, society, culture, public policy or
29 services, health, the environment or quality of life, beyond academia as the result of
30 excellent research' (HEFCE, n.d). Twenty per cent of a department's overall quality
31 weighting was given to this (with publication outputs and research environment accounting
32 for the rest of the scoring). Rumours suggest that this proportion will increase with REF
33 2020/2021. In total, over 190,000 publications and nearly 7,000 impact case studies written
34 by 52,000 full-time equivalent staff from 154 Higher Education Institutions were entered for
35 REF 2014 (Jump, 2014). In brief, these are the dimensions, the origins and some of the main
36 criticisms of the UK's Research Excellence Framework.

46 47 ***Impact and social justice?*** 48

49
50 At the inaugural meeting of the British Sociological Association's 'Activism Forum' (at the
51 BSA conference 2014), members met to discuss how sociologists could play a more
52 campaigning role in the world outside of the academy. Pragmatically, academics tend to
53 work long hours and are faced with recurrent demands of teaching, administration,
54 marketing, research grant bidding and so on (*Personnel Today*, 2013). With the ramping up
55
56
57
58
59
60

1
2
3 of the requirement to demonstrate the efficacy of our research in ‘the real world’, maybe
4 here – suggested the author, as his contribution to the meeting - was a chance for those of
5 us interested in progressing social justice to lever officially-sanctioned space, in our busy day
6 to day lives, to do more of this sort of work? Others have also pointed to the potential for
7 social good that might come from the REF impact agenda. Pettigrew suggests that it
8 ‘encourages connecting with disparate stakeholders and the pursuit of increased human
9 well-being through research’, adding that the impact agenda might have greater academic
10 legitimacy than ‘defining scholarship just in terms of publication in A-rated scholarly
11 journals’ (Pettigrew, 2011: 348, cited in Sayers, 2015).
12
13
14
15
16
17
18
19

20 Notwithstanding the generally limited coverage in social science scholarly journals about the
21 REF and its impact agenda, one productive debate that *has* been had is that between social
22 geographers, Rachel Pain and colleagues and Tom Slater, in the journal *Area* in 2011/2012.
23 Pain and colleagues (2011, 2012) cautiously welcome the REF impact agenda. They are
24 critical human geographers who draw on feminist, socialist and post-colonial theory and
25 practices. Scholars can co-opt the REF impact agenda they argue, for instance, via co-
26 production and the use of participatory methods with less powerful social groups so as to
27 enable research that is politically engaged and directed towards social justice. The authors
28 are aware of the dangers of following the narrow research questions of policy makers and
29 that research can be a prop for the status quo. In the language of governance theory local
30 practices can subvert the demands of REF to disrupt and resist the elite narrative that is the
31 neo-liberalising agenda pursued by universities (Bevir, 2013). Pain and colleagues go as far
32 as to suggest that ignoring the progressive possibilities of the REF impact agenda, and an
33 insistence on the purity of intellectual autonomy, smacks of an ‘Ivory Tower’ elitism that
34 runs the risk of ‘entrenching academics as privileged research technocrats’ (2012: 123). Far
35 more contestable and worthy of criticism than ‘impact’, they say, are the elitist and arcane
36 forms of publishing and academic esteem that REF rewards. Holmwood (2010: 14) describes
37 the sort of position taken by Pain et al as follows: ‘most social scientists are motivated by a
38 desire to improve the world and, therefore, the impact agenda can be subtly tweaked to
39 serve *public* social science - in the sense expressed by Burawoy (2005) in his advocacy of
40 public sociology’.

‘Fight this cult!’ Resisting the REF and problems with ‘impact’

1
2
3 The REF impact agenda has also been subject to significant criticism, not least in respect of
4 its technical model of impact. This implies a straightforward, linear process of cause and
5 effect between a research project and subsequent beneficial impacts. Critics question
6 whether research really does have this direct effect, at least with any regularity. Impacts are
7 often diffuse, longer term or nebulous and can arise from the combined and messy
8 influence of several pieces of research (by different universities). And only research that
9 could clearly *demonstrate* and prove its impact (e.g. through citations, user testimonies and
10 so on) is admissible to REF. Significant amounts of government funding has been made
11 available for achieving and demonstrating impact. There are even whole projects 'about'
12 impact, such as the LSE's *Impact of Social Sciences* project³. Universities have hired
13 consultants, think tanks and lobby firms so as to improve the impact of their research.
14 However, there has been 'no funding for critically exploring the influence of [the] impact
15 [agenda]. It remains largely unquestioned' (Sayers, 2015). One can add a further, related
16 criticism about the apparent power imbalance at play here. Social policy scholars are
17 regularly admonished for not making their research sufficiently accessible to non-academic
18 'research users' but there is not a similar level of expectation that those who make social
19 policy should use the research that *is* made available to them.

30
31
32
33

34 In the absence of much research literature about impact in social policy, Smith and Stewart
35 (2015, 2016) undertook interviews with social policy researchers, finding that scholars had a
36 'series of concerns about the impacts of the impact agenda on the way that we work and
37 the decisions that we make about what to study and how to talk about it' (2015). These
38 include worries about: the impossibility of ever really knowing and/ or measuring the true
39 impact of research; the politicisation of the research process, loss of independence and the
40 danger of self-censorship (e.g. sanitising results so as to increase the chances of impact on
41 government); and an a-theoretical model of impact that is detached from the relevant
42 research literature and which therefore ignores the centrality of politics and values in
43 translating research into policy and practice. These concerns were then mapped against a
44 sample of high and low scoring social policy impact case studies with Smith and Stewart
45 concluding that some but not all of academics concerns were warranted (e.g. REF seemed to
46 reify traditional academic elites, with the leads of high scoring submissions predominantly
47 being ethnically white Professors).

1
2
3 At this point we can return to the debate between Pain et al (2012) and Slater (2012) to
4 hear a more belligerent view of REF. For Slater, critical distance and academic freedom are
5 the watchwords; REF signals another turn in the screw of the neo-liberal managerial audit
6 culture. It makes 'universities into factories' that compete 'against each other for scarce
7 resources'. We should 'fight this cult, not welcome it and smooth its rough edges', he says
8 (2012: 117). Slater has a strong pedigree of critical engagement but he is highly suspicious of
9 the idea of impact, which he perceives as being driven by narrow, governmental interests.
10 Academics should set their own questions as an outcome of their intellectual engagement
11 with the world, not have these decided by others. For him, quite counter to the position of
12 Pain and colleagues, engaging with the impact agenda implies collusion with neo-liberalism,
13 not working for social justice. He says:

22
23 ... all forms of academic research, including those involving collaboration with non-
24 academics, are best pursued for reasons worked out by academics in the course of
25 their engagements with knowledge/ignorance and social life, not in the service of an
26 imposed, reductive, compromised, institutionally mediated artificial assessment
27 system that wastes a huge amount of our collective time and effort on a particularly
28 obnoxious navel-gazing exercise rooted in input-output neoclassical economics.
29
30 (Slater, n.d.).
31
32
33
34
35

36 In a similar vein, 'naive' is the label John Holmwood (2010: 16) applies to those who
37 welcomed the impact agenda as a conduit to public sociology. He is particularly critical of
38 the research councils' 'pathways to impact' approach. This, he says, has forced social
39 scientists to accept government-set strategic objectives, diminished the independence of
40 disciplinary knowledge and set UK research on 'a pathway to mediocrity'. Echoing the same
41 point, Les Back (2015) confesses 'it is embarrassing to remember that some of us - at least
42 initially - thought that "impact" promised the possibility of institutional recognition for
43 public sociology'. Back reviewed the ninety-six 'impact case studies' submitted to the 2014
44 REF for the discipline of sociology. He concluded that 80 per cent of them present a narrow
45 version of intervention that 'tinkers with minor reforms' and 'that nudges the edges of
46 policy and political influence'. The impact agenda has, he says, 'licensed an arrogant, self-
47 crediting, boastful and narrow disciplinary version of sociology in public'. He concludes that
48 'this agenda puts us on the side of the political elite, Ministers of State, Job Centre
49

3 Managers, Immigration Officers and the apparatchiks of prevailing government policy.
4 Bluntly, it puts us on the side of the powerful’.

7 ***A(n) (Impact) Case Study in Failure?***

9
10 Questions can also be asked about the real extent of the impact claimed in these impact
11 case studies. How much is real and how much is boastful hot air, as implied by Back? The
12 author’s own experiences are educative here. The feedback received from HEFCE post-
13 REF2014 meant that it was possible to deduce that the impact case study based on the
14 research conducted by the author and colleagues (entitled *Influencing thinking & shaping*
15 *practice about worklessness & poverty*) had been awarded the highest, 4* ‘world-leading’
16 rating. Of course, this was a welcome outcome but how seriously should we take any of
17 this? The case study argued that as result of the research and the efforts made to ‘slay
18 Zombie arguments’ that some impact had been had (locally, nationally and internationally)
19 on the political debate about worklessness and welfare and also on the way that
20 practitioners in these fields acted. Evidence included testimonies from practitioners,
21 mentions of the research in Parliament, presentations to select committees and so on.
22
23

24
25
26
27
28
29
30
31
32 Yet, within a few months of receiving this official endorsement of the social and political
33 impact of the research, a Conservative government was elected in part on the basis of a
34 campaign that employed exactly those welfare myths that the Teesside research had tried
35 to debunk. It is naive to expect social science research to have clear impact on a general
36 election. A straightforward relationship between research evidence and policy formation is
37 rarely obvious - even with governments that profess an interest in ‘what works’ (see
38 Monaghan, 2011). It is more plausible that research of this sort – and given all the efforts
39 made toward this end – could have impact *locally*, within Teesside and the North East.
40
41
42
43
44
45
46 Again, there is room for doubt.

47
48
49 For instance, one influential North of England organisation that is tasked with economic
50 regeneration announced a new initiative, in 2015, with a multi-million-pound budget from
51 EU funding, to tackle social exclusion and youth unemployment. Given the extent and
52 academic standing of the Teesside research on exactly these topics – and the efforts of the
53 researchers to make this research known and used locally, including via a Knowledge
54 Exchange Partnership in which this organisation participated, it is not absurd to expect some
55
56
57
58
59
60

possible impact here. Yet the new programme largely ignored this research; the literature review that launched the scheme did not refer to it and, in fact, offered an analysis that ran *directly counter* to findings of the Teesside research. Thus, it proposed to tackle ‘social exclusion’ and ‘the problem of long-term NEET’, and to make unemployed young people ‘more work ready’ by ‘raising their aspirations’. Each of these stated ambitions are contentious. ‘Social inclusion’ is not guaranteed by labour market entry. In fact, the proportions of people locally, in Teesside, who are ‘long-term NEET’ are tiny, probably less than 1 per cent of the 18-24 year age group (TVU, 2015). There is little evidence that unemployment is caused by ‘low aspirations’. High rates of graduate un- and underemployment in Teesside would seem to point to the flaw in this thinking (TVU, 2014). The emphasis on improving ‘work readiness’ ignores the failures of existing schemes to do exactly this; only 8 per cent of long-term unemployed people from Middlesbrough who take part in the government’s ‘Work Programme’ succeed in finding lasting employment (Northern Echo, 2013). Overall, the approach of this multi-million pound scheme fails to appreciate how the problem of youth unemployment in Teesside is, essentially, a problem of the demand side of the economy (i.e. a deficit in the quantity and quality of employment and training opportunities) rather than a deficit of the supply side (e.g. young people are unemployed because they have insufficient aspiration). That locally there are typically 28 applications for every single manufacturing apprenticeship underscores this point (TVU, 2014).

‘Fat Cat Sociology’ Revisited: the case for critical public social science

The author’s experience here would seem to demonstrate the simultaneous failure of the research to have real impact and the flawed nature of the REF exercise (in that it judged that impact as ‘world leading’). Should we join Les Back, Tom Slater and others in calling for resistance to the REF, particularly to the ‘impact agenda’?

This is a difficult question to answer. One response is pragmatic. Regardless of trenchant criticisms, it is unlikely that such exercises will disappear from or diminish in significance in UK academia. Burrows (2012) documents just how widespread and pervasive market-driven ‘metric assemblages’ (such as REF) have become in the contemporary academy, how difficult it is to ‘*not* play the numbers game’ and how opportunities for resistance are

1
2
3 unclear. Sayers (2015) concludes his assessment by noting that 'the emphasis on impact is
4 probably likely to grow' and that there is 'no sign of collective revolt'. Furthermore, Smith
5 and Stewart (2015, 2016) have decried the absence of social policy academics in on-going
6 arguments about the impact agenda because theirs would be a particularly expert view.
7
8 Very importantly, as well, critics of the REF impact agenda can still see some space for more
9 positive, progressive work. In Les Back's critical assessment, around 20 per cent of impact
10 case studies 'showed radical ambition'⁴. He says that:

11
12
13
14
15
16 in the most appealing and compelling cases, clusters of scholars worked together to
17 try and shift the public agenda through evidence and critical enquiry that challenged
18 conventional thinking... and these examples offer an alternative way to think about
19 how to hold to a public commitment within the current climate⁵.
20
21
22
23

24 The point here is that even if its critics are correct that the REF is primarily an example of
25 the increased neo-liberal control and audit culture of UK higher education, it might *still*
26 provide some room for manoeuvre – for space to engage in a positive, progressive politics
27 of research impact (amidst all the other workload pressures academics face). Local practices
28 can disrupt and re-form how dominant narratives of REF and impact 'are done'. There are,
29 for instance, examples in current sociology of particularly younger, feminist academics
30 trying to find new modes of collaborative practice (inspired by notions of 'punk sociology')
31 that resist the 'present conditions' that 'conjure competition and individualisation among
32 academics' (Jackson, 2016). Thus, *regardless* of our particular perspectives on REF and its
33 impact agenda there is a long-standing tradition of critical social science that seeks to
34 change the world for the better. This too can be drawn on in resisting current elite
35 narratives (for instance, about the so-called underclass or, indeed, that seek to degrade
36 research to research metrics and narrow notions of impact⁶).
37
38
39
40
41
42
43
44
45
46
47

48 One important moment was the famous address of Martin Nicolai in 1968 to the American
49 Sociological Association conference, attacking 'Fat Cat Sociology': 'the eyes of sociologists,
50 with few but honorable (or honorable but few) exceptions, have been turned downward,
51 and their palms upward. Sociologists stand guard in the garrison and report to their masters
52 on the movements of the occupied populace'. This old radical impetus was given new
53 momentum by Burawoy's important (2005) call *for* public sociology - to be a social scientist
54
55
56
57
58
59
60

1
2
3 but also to intervene in social life - which returned to the debate in sociology about if, how
4 and the extent to which academics should be engaged in critical, public social science (see
5 McLaughlin et al, 2014 for a recent review). A year earlier than Nicolaus's address, Howard
6 Becker's essay 'Whose Side Are We On?' is even more influential and famous. Both take the
7 position that it is impossible for sociology to be simplistically 'value-free' and 'objective'.
8 Nicolaus's attack on the US sociological establishment was because it implicitly propped up
9 the ruling interests of the US government and the unequal status quo whilst professing
10 'objectivity'. Similarly, Becker (1967) took the following position: 'the question is not
11 whether we should take sides, since we inevitably will, but rather whose side we are on'.
12
13
14
15
16
17
18
19

20 Warren and Garthwaite (2015) have returned to these same questions, in the modern
21 context. They say we should recognise that 'research will be on a side' but that it is the
22 credibility, integrity, skill, honesty and craft of the academic enterprise that gives social
23 scientists a place in the now crowded market of experts, pundits, think-tanks and
24 evaluators. Incidentally, that policy formers were looking for 'expertise and wisdom', rather
25 than the hard results of single studies, was also a conclusion from Smith and Stewart's
26 (2015) research about REF impact. In defending the idea of 'public sociology' (in
27 comparison, for instance, to 'professional sociology') Burawoy insists that it must also
28 maintain methodological rigour: 'public sociology cannot be second rate sociology'
29 (Burawoy, 2005: 25; see also McLaughlin et al, 2014). This same stress on combining
30 academic rigour with public engagement was repeated by the British social policy professor,
31 David Donnison, at the 2015 *Social Policy Association Conference*, when he reflected on the
32 diminishing influence of social policy academics on national government, from the 1950s
33 until now⁷. Warren and Garthwaite (2015) conclude by raising questions about who we
34 write for (and one could add *how* and *where* we write, if we seek wider engagement with
35 different audiences) emphasising the importance of academic freedom to the survival of
36 academic research. Only writing so as to satisfy the next assessment 'metric' or to produce
37 sanitised results pleasing to funding bodies threatens this academic integrity and,
38 subsequently, therefore our main public value.
39
40

42
43
44
45
46
47
48
49
50
51
52
53

54 A line can be traced from US sociological concerns about a partisan and public sociology
55 (from Nicolaus and Becker through to Burawoy) to the French critical sociology of Bourdieu
56 and Wacquant. In a short article from 2000, Bourdieu pre-empts the arguments of Warren
57
58
59
60

1
2
3 and Garthwaite by stressing the need for 'scholarship with commitment' (2000: 40); that
4 scholars can and should act as 'public intellectuals, that is people who invest in a political
5 struggle their specific authority and the values associated with the exercise of their craft,
6 such as the values of disinterestedness and truth'. Ruling ideas get spread in new ways so
7 the need for this committed scholarship increases. Incidentally, Bourdieu's mention here of
8 the role of think tanks in proliferating neo-liberal ideology is met well by Tom Slater's (2014)
9 critique of the *Centre for Social Justice* (a UK right-of-centre think-tank) and its role in
10 'agnotology'; or the *production* of ignorance and their use of state power to spread mis-
11 information about poverty, unemployment and the need for welfare reform. Slater (2014:
12 248) shows that the 'structural causes of poverty have been strategically ignored' in favour
13 of the invocation of 'a familiar litany of social pathologies' in order to 'manufacture
14 ignorance of alternative ways of addressing poverty and social injustice'. So, returning to
15 Bourdieu (2000: 44), the challenge for sociological researchers is to transcend the false
16 divide 'between scholarship and commitment, in order to break out of the academic
17 microcosm, to enter into sustained and vigorous exchange with the outside world
18 (especially with unions, grassroots organisations and issue-oriented activist groups)'.
19
20
21
22
23
24
25
26
27
28
29
30
31

32 In another short essay, from 2001, Loïc Wacquant adds some meat to this line of argument.
33 He estimates that the social scientific *potential* for critical public engagement has never
34 been greater but the challenges set against us are similarly extensive. In the United States,
35 he says, 'policy research' now 'plays the lead role as a cover and shield against critical
36 thought by acting in the manner of a "buffer" isolating the political field from any research'
37 that is independent or radical in its implications for public policy. Neither has Wacquant any
38 time for the sociological fashion for 'soft culturalism' when in fact we need an historical and
39 materialist analysis to challenge the spread of 19th century forms of poverty, the concerted
40 dismantling by government elites of welfare state 'social safety nets', a class structure that
41 is becoming more rigid and polarized and 'a transnational bourgeoisie' that has gained 'an
42 unprecedented capacity for domination'. 'False thinking and false science have never been
43 so prolix and so omnipresent', he concludes.
44
45
46
47

49
50
51
52
53
54

55 This call to arms for a critical, public social science to challenge the dominant myths and
56 modes of thinking of our times is one that is both inspirational and practical. It chimes
57
58
59
60

1
2
3 exactly with the interests and motivations of the research as set out at the start of this
4 paper; that is, research that questioned and challenged dominant UK myths about work,
5 worklessness and welfare on the basis of a rigorous social science approach that also sought
6 to engage widely with different audiences. Wacquant puts this role like this: 'the primary
7 historical mission of critical thought, [is] to serve as the solvent of doxa – to perpetually
8 question the obviousness and the very frames of civic debate so as to give ourselves the
9 chance to think the world'. It is difficult to imagine a more doxic set of false thinking than
10 that embedded in the idea that there are 'families where three generations have never
11 worked' and that unemployment in the UK can be explained by 'cultures of worklessness'.
12 Yet these *are* 'the frames of civic debate', shared across political parties that seek to
13 separate out the deserving from the undeserving poor, the 'shirkers' from the 'strivers', and
14 in so doing divert attention away from the real causes and experiences of poverty and
15 unemployment.

25
26

27 **Summary and Conclusion**

28
29
30 The first part of the paper described research undertaken by the author and colleagues
31 about working-class people's experiences of unemployment and economic marginality. The
32 research challenged elite narratives about 'cultures of worklessness' that have become
33 popular with politicians and the general public and which, under the name of austerity, have
34 been used by government as the basis for swingeing cuts to the UK's welfare state
35 provision. The influence and resilience of underclass theories provides a perfect example of
36 how an elite narrative can become taken-for-granted, common-sense. These ideas have
37 been likened to Zombies; they keep coming back to life no matter how many times
38 researchers try to kill them off. Thus, ironically given the focus of this paper, they also
39 provide a perfect example of how notions of social science 'research impact' can be
40 Pollyanna-ish and simplistic: social scientists have, over decades, repeatedly and successfully
41 demonstrated the falsity of underclass ideas yet they continue to be the basis of much
42 government thinking and policy.
43
44
45
46
47
48
49
50
51
52

53
54 The paper then considered new systems for research governance in the UK (which are also
55 present in other countries), specifically the Research Excellence Framework and its 'impact
56 agenda', identifying positions 'for' and 'against'. In terms of the latter, it certainly can be
57
58
59
60

1
2
3 regarded as another tightening of the neo-liberal, managerial audit culture that infests
4 universities. There is clearly an elite narrative at work here that has succeeded in governing
5 the day to day practices and longer-term goals and orientations of social scientists in the UK.
6
7 Consequently, speaking of sociology, Les Back (2015) says that ‘the “impact agenda” is
8 coming to constitute our self-understanding, guide our decisions around job appointments,
9 and...limit[ing] the public ambition of our discourse’. The genealogy of this is rooted
10 historically in governmental calls for greater accountability in respect of returns on public
11 investment, anti-intellectual suspicions about the activities and ‘value for money’ of
12 university academics and the growing marketisation, commodification and privatisation of
13 universities and academic life. The foundational premise is that academics, in return for
14 research funding, increasingly must demonstrate their value to economy and society.
15
16 Impact, as championed by REF and the research councils, threatens the imposition of official
17 governmental policy priorities that limit academic freedom and narrow research agendas.
18
19 Certainly, too, the realities of impact can be ephemeral or over-stated, even when judged by
20 the REF to be of the highest calibre, as was demonstrated in respect of the effects of the
21 Teesside research. Increasingly, to adapt Wacquant’s phrase, the REF sets the ‘the very
22 frames of debate’ about what constitutes ‘good research’. Thus, REF and the wider impact
23 agenda do have the potential to *limit* critical, radical social science (one clear and simple
24 route to this is if social policy impact becomes narrowed down to impact government policy;
25 a rare enough possibility even when governments claim an interest in evidence-based policy
26 making).

27
28
29
30
31
32
33
34
35
36
37
38
39
40
41 Some critics would hold that even ‘playing the REF game’ adds legitimacy to a corrupt and
42 corrupting system. This may be true but it is *also* possible to conclude, however, that REF
43 and its impact agenda carry opportunities for progressive social science. Pragmatic matters
44 shouldn’t be underestimated. ‘Impact activities’ are increasingly allowed - demanded - in
45 otherwise constrained academic workloads. This gives institutional space and valorisation
46 for engaged, critical public social science (of the sort attempted from the Teesside projects).
47
48 And as Sayers (2015) puts it, ‘pursuing impact can be more than slavish adherence to
49 imposed priorities’; Back saw at least some positive cases of this in his review. In the
50 absence of collective opposition, pragmatism and the even small possibilities presented by
51 ‘playing the REF game’ should not be dismissed. Smith and Stewart (2016) conclude that
52
53
54
55
56
57
58
59
60

possibilities remain for social policy academics to enter this debate more vigorously and to draw on our own theory and research so as to better influence relationships between research(ers) and policy (makers).

Of course, social scientists are unlikely to engage in critical, public social science *because* of the REF and its impact agenda (it is unlikely that Nicolaus, Becker, Bourdieu and Wacquant would be fans). The imperative is much deeper set than that – but REF can *potentially* help to enable it. The drive to confront dominant ideologies, to attack inequalities and to work for social justice has a long history in social science and there has only been space to mention a few important contributions. Victories can be few, small, easily reversed and sometimes hard to see at all. To wave the white flag, to retreat to the comfort of the ivory tower and to become lost in the labour of papers for arcane scholarly journals can be tempting. At such moments, as Henry Giroux warns us, we must resist this ‘debilitating pessimism’ and ‘the politics of cynicism’ (2006: 13, 7). In describing ‘critical pedagogy’ and the responsibilities of the public intellectual, Giroux echoes Wacquant’s (2001) emphasis on the politically and sociologically transcendental possibilities of critical thought:

Even if the forces of domination and oppression seem insurmountable and the possibility of progressive social change invisible, we must retain a ‘language of possibility’ that allows us to ‘think in terms of the “not yet”, to speak the unrepresentable, and to imagine future social relations outside of the existing configuration of power (Giroux, 2006, 7).

This is Giroux’s challenge, and rallying cry, to those of us who seek progressive social change from the Left. To finish, and perhaps to underline the potential that Bourdieu, Wacquant, Giroux and others allude to in their calls for a critical, public sociology that works against the current state of things, it can be noted that ‘they’, on the political Right, have long understood this same message. Giroux’s statement finds its almost exact match, some decades earlier, in Milton Friedman’s (1962/ 1982: xiv) view on the political function of his writings on free-market economics:

Only a crisis - actual or perceived - produces real change. When that crisis occurs, the actions that are taken depend on the ideas that are lying around.....That, I believe, is

our basic function: to develop alternatives to existing policies, to keep them alive
and available until the politically impossible becomes the politically inevitable.

38 NOTES

39
40 ¹ See <http://impact.ref.ac.uk/CaseStudies/Results.aspx?val=macdonald%20teesside>

41 ²For example, by appointing staff with strong research profiles for short periods only (on fractional contracts)
42 or re-designating others as 'teaching only' staff so removing them from the count.

43 ³ See <http://blogs.lse.ac.uk/impactofsocialsciences/>

44 ⁴ Back examined: i) how closely the case study was linked to the user's interest, ii) whether the case study
45 challenged sociologically the terms of the problem, and iii) whether there was reference to critical questioning
46 of the issues' wider societal dimensions (Back, 2016, personal communication).

47 ⁵ Incidentally, and in a nutshell, this is what our case study *attempted* (Back will not have reviewed ours
48 because we submitted it to the Social Policy not the Sociology REF panel).

49 ⁶ For example, see the resistance by staff and unions to Newcastle University's 'Raising the Bar' performance
50 management regime (<https://www.staff.ncl.ac.uk/nick.megoran/HTML/rtb.html> and
51 <http://www.chroniclive.co.uk/news/north-east-news/newcastle-university-professors-set-refuse-11400473>).

52 ⁷ Coincidentally, one target of his ire was the ideological, evidence-free nonsense peddled by government
53 about families where 'three generations have never worked' (i.e. the exact focus of the author's research).
